WABCO eTASC

The New Generation in Suspension Control

The eTASC valve option has been designed to provide all the benefits of ECAS as well as a manual override should the EBS fail or the truck ABS power fail.

- Reduced air and fuel consumption due to the suspension solenoid block not reacting to every bump, only sustained level changes.
- Reduced wear on the height control system due to reduced opening and closing of valves.
- Automatic lowered ride height at high speed to aid stability.
- Automatic return to ride height after level changes via the raise/lower handle.
- The level set via the handle is maintained during loading and unloading of the trailer as long as the truck ignition is on.
- The raise/lower handle can be used to set the trailer to ride height should the power supply fail.
